

Question #2

Assuming

Parents run first.

Output:

PARENT0
PARENT0
PARENT0
PARENT0
CHILD0
CHILD1
CHILD2
CHILD3
CHILD4

Explanation:

for u, return gets 2 values, >0 or 1. if we get >0 we are in Parent Process, whose PARENT is copied in buffer and 0 is also is displayed in loop. Then when 1 is returned we have another copy of code so mynum will be zero, and in loop child is displayed and mynum is incremented.
